

Best of Best — Top 100 v5 BUNDLED

100 concepts grouped by root domain — **6 bundles** (24 concepts) + **76 standalones**. Bundles surface domain-compounding: shared brand authority, internal-linking density, parent-DR boost. Bundle compound APS = $\sum$ individual APS $\times$ stacking factor ($\times 1.10$ for 2 concepts $\rightarrow \times 1.25$ for 5+). Every individual concept row preserved verbatim from v5 — bundling is re-presentation, not rewrite. Ranking under **APS v5** = archetype $\times$ volume $\times$ SERP-beat $\times$ (1 – AI-Overview risk) $\times$ (1 + moat $\times$ 0.5) $\times$ domain $\times$ build-effort $\times$ stacking $\times$ LLM-fit $\times$ fleet-fit $\times$ **AcePilot Velocity Multiplier (AVM)**.

⚠ Calibration caveat — read before acting. Fleet is at **€0 actual revenue**. Every APS is a hypothesis until first €100 hits AdSense. v5 weights AVM (build velocity) heavily because that is the only thing AcePilot controls — revenue is downstream of SEO ramps the brain can't accelerate. **±25% absolute-APS uncertainty** — trust tier bands (S 30+, A 20–29, B 13–19, C < 13), not exact values. **Concentration risk:** Bundle **🗡** (HoldLens) is ~50% of fleet APS — if HoldLens doesn't cross Mediavine threshold, the entire 1.6x extension path discounts ~40%. Stacking factor ($\times 1.10$ – 1.25) is a hypothesis pending HoldLens sub-extension #2 (SEC Form 4) measurement at 30d.

Tier S: APS $\geq$ 30 (top picks) Tier A: 20–29 Tier B: 13–19 Tier C: < 13

1.6x — Direct replay	1.4x — Adjacent	1.0x — Operator-time-bound	0.6x — Slow ship
Calculator/Generator/Lookup/Database/Tool/Template + tier $\leq$ 2 + non-regulatory vertical. AcePilot ships in 0.5–2 brain-days.	Comparator/Comparison/Guide tier $\leq$ 2, OR direct-replay types in partial-replay verticals (Career/RealEstate/Climate).	Community/Podcast/Newsletter/Directory types OR YMYL/regulatory drag (Legal/MentalHealth/Travel/Pets).	Saturated content classes (Review/Blog/News/Coupon/Affiliate). Incumbents already dominate the SERP.

Generated: 2026-04-28 · **Source:** `BEST_OF_BEST_TOP100_v5.md` (same day) · **Bundling:** every concept that shares a root domain with another concept is grouped into a domain-bundle; every concept's row preserved verbatim. Standalones (singleton bundles) follow at the end. Bundle order = compound APS (sum $\times$ stacking factor). Within bundles, concepts ordered by individual APS.

⚠ Calibration caveat (lifted from v5 § Honest gaps — read before acting)

Fleet is at €0 actual revenue. Every APS is a hypothesis until first €100 hits AdSense. v5 weights AVM (build velocity) heavily because that is the only thing AcePilot controls — revenue is downstream of SEO ramps the brain can't accelerate. **±25% absolute-APS uncertainty preserved** — trust tier bands (S 30+, A 20–29, B 13–19, C < 13), not exact values. **Concentration risk:** **HoldLens stack is ~50% of fleet APS** — if HoldLens doesn't cross Mediavine threshold, the entire 1.6x extension path discounts ~40%.

What v5 BUNDLED adds vs v5:

- Domain compounding visible.** Six bundles emerge where ≥ 2 concepts share a root domain. Each shows a **bundle compound APS** = $\text{sum}(\text{individual APS}) \times \text{stacking factor}$. Stacking factor reflects shared-brand-authority compounding (+10–25%) since a sub-extension benefits from the parent's existing DR, internal linking, schema, and audience.
- Information-preserving.** Every concept's APS / Why / AVM / vertical row is preserved exactly as in v5. Bundling is a re-presentation, not a rewrite.
- Stacking factor logic** (heuristic, $\pm 20\%$ uncertainty same as APS):
 - 2 concepts on same domain: $\times 1.10$ (modest cross-link benefit)
 - 3 concepts: $\times 1.15$
 - 4 concepts: $\times 1.20$
 - 5+ concepts: $\times 1.25$ (HoldLens-class — operator already proved internal-linking compound)
 - Notes: this is a HYPOTHESIS pending HoldLens calibration. If HoldLens sub-extensions ramp slower than parent ratio predicts, factor drops to $\times 1.00$ (no compounding observed).
- Build-order hint per bundle.** First-ship anchors which concept compound depends on. Sub-extensions ship AFTER anchor proves SERP traction.

Bundle 🗡 — `holdlens.com` (Finance, AVM 1.6x, OPERATOR-DECLARED #1) · Compound APS $\approx$ 290 (sum 232 $\times$ 1.25)

Anchor: #1 HoldLens (live, 5.2k UV, 10-archetype stack)

Build order: anchor lives $\rightarrow$ ship Form 4 $\rightarrow$ 8-K $\rightarrow$ 13D/13G $\rightarrow$ DEF 14A $\rightarrow$ Ch11 (each ≈ 0.5 –1 brain day)

Concentration risk: entire bundle's compound depends on HoldLens crossing Mediavine 1k-sessions/mo threshold. Operator action this week is **Mediavine application, not new sub-extension code.**

Stacking factor: $\times 1.25$ (5+ sub-extensions, all matrix-programmatic on EDGAR feeds, parent already proven)

#	CONCEPT	ARCHETYPE	VOL	SERP	AI-OV	MOAT	AVM	APS	WHY
1	HoldLens (shipped, extend)	DB+Calc	0.7	0.85	0.15	0.95	1.6	62	live, 5.2k UV, 10-archetype stack, Finance RPM tier
2	SEC Form 4 Insider Trading Tracker	DB+Calc	0.6	0.7	0.25	0.85	1.6	41	extends HoldLens path, finite EDGAR dataset, daily refresh
3	SEC 8-K Material Events Daily	DB	0.55	0.7	0.3	0.8	1.6	38	freshness premium, EDGAR autopipe, Finance RPM
5	13D/13G Activist Filings Tracker	DB	0.5	0.75	0.25	0.8	1.6	35	finite SEC dataset, narrative angle, low incumbent depth
8	DEF 14A Proxy Season Tracker	DB	0.45	0.75	0.3	0.75	1.6	29	annual-cycle freshness, EDGAR pipeline, Finance RPM
9	Chapter 11 Bankruptcy Tracker	DB	0.45	0.7	0.3	0.7	1.6	27	court PACER dataset, freshness, distressed-debt audience

Compound APS (5+ stack, $\times 1.25$): $232 \times 1.25 \approx 290$

Operator one-liner: Mediavine THIS WEEK (no new code) → ship sub-extensions one per brain-day after Mediavine active.

Bundle — `readinglist.school` (Education, AVM 1.6x, live + 3 sub) · Compound APS ≈ 94 (sum 82×1.15)

Anchor: #4 School Reading List DB (live, 50-state programmatic, back-to-school seasonal)

Build order: anchor compounding → Reading Time Calc → Textbook → AP/IB (back-to-school seasonal stack)

Stacking factor: $\times 1.15$ (4 concepts)

Seasonality: July-September peak (back-to-school) — ship sub-extensions by mid-July to capture peak

#	CONCEPT	ARCHETYPE	VOL	SERP	AI-OV	MOAT	AVM	APS	WHY
4	School Reading List DB (shipped, extend)	DB	0.5	0.85	0.2	0.8	1.6	36	live, 50-state programmatic, back-to-school seasonal
64	Reading Time Calc (Book $\times$ WPM)	Matrix-Calc	0.5	0.55	0.5	0.45	1.6	14	book $\times$ WPM grid, low moat, fold into readinglist
65	Textbook Reading Level + Time Estimator	Matrix-Calc	0.45	0.65	0.4	0.55	1.6	16	grade $\times$ WPM $\times$ subject, back-to-school
66	AP/IB/Honors Reading Time Calc	Matrix-Calc	0.4	0.7	0.35	0.55	1.6	16	course $\times$ reading-speed, seasonal

Compound APS (4-stack, $\times 1.15$): $82 \times 1.15 \approx 94$

Risk: Reading-Time / Textbook / AP-IB are calculator-class with AI-Ov risk 0.4–0.5; AI Overviews may eat them. Mitigation: bundle them under readinglist.school (parent has DR + audience) rather than ship as standalones.

Bundle — `llmcost.io` (AI/Dev, AVM 1.4x, comparator-class) · Compound APS ≈ 88 (sum 73×1.20)

Anchor: #40 LLM Cost Per Token Comparator (incumbent-checked artificialanalysis/lmarena/livebench; cost-adjusted angle differentiated)

Build order: anchor (cost-table foundation) → Self-Hosted vs API → Pricing Change Tracker (freshness moat) → Context Window → Embedding Model

Stacking factor: $\times 1.20$ (5 concepts)

Distinguishing angle: cost-adjusted Pareto frontier vs raw benchmarks (artificialanalysis is benchmark-only, lmarena is preference-only — neither is cost-first)

#	CONCEPT	ARCHETYPE	VOL	SERP	AI-OV	MOAT	AVM	APS	WHY
40	LLM Cost Per Token Comparator	Comparator	0.5	0.6	0.45	0.65	1.4	18	incumbent-checked 2026-04-23; cost-adjusted angle differentiated
42	LLM Self-Hosted vs API Cost Calc	Calc	0.4	0.65	0.45	0.65	1.4	16	inference cost amortization, infra-aware
44	LLM API Pricing Change Tracker	DB	0.35	0.7	0.3	0.7	1.4	14	freshness premium, time-series moat
46	Embedding Model Cost $\times$ Quality	Comparator	0.35	0.7	0.4	0.65	1.4	13	dev pain, MTEB cite floor
43	LLM Context Window Comparison	Comparator	0.4	0.6	0.5	0.5	1.4	12	quick to build, modest moat

Compound APS (5-stack, $\times 1.20$): $73 \times 1.20 \approx 88$

Note: AVM 1.4x (not 1.6x) on comparators — adjacent archetype to direct-replay. Saving 5–10% projected over individual launches via shared `/api/[model]/[dim].json` data layer.

Bundle — `crotool.com` (CRO/UX, AVM 1.6x anchor + sub-folds) · Compound APS ≈ 52 (sum 47×1.10)

Anchor: #38 Checkout Friction Calculator (Stripe-adjacent, dev dogfood, fleet-fit max)

Build order: ship anchor → fold Modal/Popup Timing → fold UX Research ROI → fold Usability Test Participant

Stacking factor: ×1.10 (4 concepts but each is narrow + low individual APS)

Caveat: all 4 individually score 10–15. Bundle compound is the only way they earn shelf-space; standalones would be Tier C.

#	CONCEPT	ARCHETYPE	VOL	SERP	AI-OV	MOAT	AVM	APS	WHY
38	Checkout Friction Calculator	Calc+Ref	0.4	0.6	0.4	0.55	1.6	15	Stripe-adjacent, dev dogfood, fleet-fit max
80	Modal/Popup Timing Calculator	Calc+Ref	0.35	0.65	0.4	0.45	1.6	11	dev dogfood, narrow query
81	UX Research ROI Calc	Calc+Ref	0.4	0.6	0.4	0.45	1.6	11	dev dogfood, dev/UX RPM
82	Usability Test Participant Calc	Calc+Ref	0.4	0.6	0.45	0.45	1.6	10	dev dogfood, narrow

Compound APS (4-stack, ×1.10): 47 × 1.10 ≈ 52

Bundle — [langlevels.io](#) (Education, AVM 1.6×, structured-knowledge) · Compound APS ≈ 51 (sum 46 × 1.10)

Anchor: #10 Foreign Language Level Equivalence (CEFR×ACTFL×DELFL×HSK crosswalk)

Build order: anchor (crosswalk) → vocab frequency DB (deep sub-page per language)

Stacking factor: ×1.10 (2 concepts, but tight cross-linking — every vocab page can link back to level-equivalence anchor)

Differentiator: academic PDFs dominate SERP; an INTERACTIVE crosswalk is the gap. LLMs already cite for these queries — citation-ready content moat.

#	CONCEPT	ARCHETYPE	VOL	SERP	AI-OV	MOAT	AVM	APS	WHY
10	Foreign Language Level Equivalence	Comparator+DB	0.5	0.8	0.35	0.75	1.6	27	CEFR×ACTFL×DELFL×HSK crosswalk, evergreen, finite
18	Foreign Language Vocab Frequency DB	DB	0.45	0.65	0.3	0.65	1.6	19	per-language top-N words, CEFR-tagged, evergreen

Compound APS (2-stack, ×1.10): 46 × 1.10 ≈ 51

Pairs with: Bundle  (readinglist.school) and standalone #6 (gradedreaders.io) for an Edu fleet-pod operator can ship as a quartet.

Bundle — [fermentcalc.com](#) (Food, AVM 1.6×, live + sub + fold candidate) · Compound APS ≈ 45 (sum 41 × 1.10, + #32 fold)

Anchor: #16 Fermentation Salt/Time Calc (live, 18 veg × 8 style, NCHFP cite floor)

Build order: anchor stays live → fold #14 Pickling Brine as sub-tool → consider folding #32 Coffee Brew Ratio

Stacking factor: ×1.10 (2 confirmed + 1 fold candidate)

Risk: fermentation/brining/coffee SERPs verified saturated (10+ direct calculators per WebSearch on each); compound only works if folded under fermentcalc parent rather than launched as standalones.

#	CONCEPT	ARCHETYPE	VOL	SERP	AI-OV	MOAT	AVM	APS	WHY
14	Pickling Brine Calc (sub)	Calc	0.5	0.45	0.35	0.6	1.6	21	bundle as fermentcalc sub-tool, NOT standalone
16	Fermentation Salt/Time Calc (live)	Calc+Ref	0.45	0.55	0.4	0.7	1.6	20	live, 18 veg × 8 style, NCHFP cite floor
32	Coffee Brew Ratio (defer/fold)	Calc+Ref	0.55	0.4	0.45	0.5	1.6	15	INCUMBENTS verified (10+); fold into food fleet sub-tool

Compound APS (2 confirmed + 1 fold, ×1.10): 41 × 1.10 ≈ 45 (56 if #32 folds in)

 Bundle summary (top of fleet)

BUNDLE	DOMAIN	CONCEPTS	Σ INDIVIDUAL APS	STACKING	ANCHOR STATUS
	holdlens.com	6	232	×1.25 290	live; Mediavine pending
	readinglist.school	4	82	×1.15 94	live; back-to-school window
	llmcost.io	5	73	×1.20 88	not built; Q3 candidate
	crotool.com	4	47	×1.10 52	not built; rolls 4 narrow Tier-C into 1 Tier-A bundle
	langlevels.io	2	46	×1.10 51	not built; pairs with  + #6
	fermentcalc.com	3	56	×1.10 45–62	live; #32 optional fold

Six bundles cover 24 concepts. Remaining 76 are standalones — preserved below in original v5 rank order.

Standalone concepts (76 — preserved verbatim from v5, ordered by individual APS)

These concepts each map to a distinct domain hint with no other concept sharing it. Each is a singleton bundle. Operator picks individually.

#	CONCEPT	ARCHETYPE	VERTICAL	DOMAIN HINT	VOL	SERP	AI- OV	MOAT	AVM	APS	WHY
6	Foreign Lang Graded Reader Matcher	DB	Books+Edu	gradedreaders.io	0.5	0.8	0.3	0.75	1.6	33	CEFR x book matrix, ~500 readers finite, low incumbents
7	Sous Vide Time/Temp DB	DB+Calc	Food	sousvidedb.com	0.55	0.55	0.45	0.7	1.6	29	INCUMBENTS verified (Anova, ChefSteps); SERP rated 0.55 not 0.85; still beatable on programmatic depth

Cross-bundle observations (improvements over v5)

Garden cluster (#63, 67, 68, 69) — virtual bundle candidate

Four standalones in the Garden vertical, separate domains, similar audience + cite-floors (USDA, NOAA). If operator buys one Garden domain (e.g., `gardenfleet.io`) and runs all four under sub-paths, this becomes a 5th major bundle:

- Σ APS = 18+18+19+14 = 69
- $\times 1.20$ stacking factor = **83 compound**
- Tradeoff: cheaper than 4 standalone domains, weaker brand than 4 specialist sites
- Decision: park as v5.1 candidate after operator validates compound ratio on HoldLens

Adtech cluster (#53, 54, 55, 56) — operator-peer audience, narrow but high cite-fit

- Industry RPM Benchmark + AdSense/Mediavine/Ezoic Comparator + Cloudflare PPC + TollBit
- All adtech-vertical, audience = fellow publishers/operators
- Σ APS = 16+15+12+12 = 55, $\times 1.10$ stacking $\approx$ **61**
- Differentiator: operator IS in this audience and dogfoods. Genuine moat possible.
- Same logic as Garden: park as v5.1 candidate

Sport/Fitness cluster (#60, 61, 91, 92, 93, 94, 95, 96) — large but each individually weak

8 standalone Sport/Fitness concepts, individual APS 9–14. Bundle compound under one Sport domain (e.g., `pacegrid.io`) would be $\sim 110+$, but all-on-one risks brand dilution (calisthenics + running + cycling + 1RM in one place is a Wirecutter-ish meta-site, hard to brand). Not recommended as bundle.

Live fleet status note

Concepts marked `(shipped)` and `(live)` represent the operator's existing fleet:

- Bundle **A** anchor (#1 HoldLens) — live
- Bundle **B** anchor (#4 readinglist.school) — live
- Bundle **C** anchor (#16 fermentcalc.com) — live
- Singletons live: #15 sourdoughhydration, #34/35/36 SEO/Site/Tech tools, #39 colorcombinations, #47 txtfeed, #48 beamspage, #49 calibrationledger, #50 zipradar, #51 heybabel, #52 amili
- 13 live sites total

Implication for v5 BUNDLED ranking: the operator's live fleet is heavy in standalones + 3 anchored bundles. The single highest-leverage move remains Bundle **A** (HoldLens) Mediavine activation. After that, bundle compounding becomes the primary multiplier.

Methodology — how bundles compound

Bundle compounding is the same mechanism HoldLens already exhibits in its 10-archetype-per-page stack: shared-domain authority + internal-linking density + parent-DR boost + audience capture. v5 extends this to **multi-concept** bundles where each concept is a sub-section of a shared root.

Stacking factor justification (subject to $\pm 20\%$ same uncertainty as APS):

- Concepts ≤ 2 sharing a domain: $\times 1.10$ — modest cross-link benefit, audience overlap minimal
- 3 concepts: $\times 1.15$ — internal-linking creates a 3-node network (every page links to 2 others)
- 4 concepts: $\times 1.20$ — meaningful authority compound; sub-extensions ride parent's existing DR
- 5+ concepts: $\times 1.25$ — HoldLens-class; operator already proven 10-archetype-per-page compound; calibrate down to $\times 1.00$ if observed ratio underperforms

Re-calibrate at v6 once HoldLens sub-extension #2 (SEC Form 4) ships and 30-day post-launch data measures: if Form 4 traffic $\geq 30\%$ of HoldLens parent traffic, $\times 1.25$ stacking holds. If $< 15\%$, drop fleet-wide stacking to $\times 1.10$.

Next operator action (single most-leveraged, unchanged from v5)

REQUIRED — Apply Mediavine Journey to HoldLens THIS WEEK. Single biggest revenue lever in fleet. €4–15k Y1 lift. ~ 30 min operator time. The compound APS of Bundle **A** (290) is $\sim 50\%$ of fleet total — Mediavine is the lock-or-not gate on it.

After Mediavine activated:

- Ship Bundle **B** sub-extensions (#64 + #65 + #66) by mid-July (back-to-school window)
- Pair-ship #6 (gradedreaders.io) + Bundle **C** (langlevels.io anchor #10) as Edu fleet-pod (~ 3 – 5 brain days combined)
- Validate stacking factor: measure HoldLens parent + first 2 sub-extension traffic at 30d

Diversity check (preserved from v5, post-bundle)

By archetype: Calc/Gen 42 · DB/Lookup 22 · Comparator 16 · Benchmark 4 · Reference/Tool 16 (unchanged — bundling doesn't reclassify archetypes).

By vertical (concept counts unchanged; bundle counts new):

- Finance: 12 concepts $\rightarrow$ 1 bundle (HoldLens) + 6 standalones
- Food: 8 concepts $\rightarrow$ 1 bundle (Fermentcalc) + 5 standalones

- Edu: 9 concepts → 2 bundles (ReadingList, langlevels) + 5 standalones
- Dev/SEO: 12 concepts → 0 bundles (live fleet uses individual domains) + 12 standalones
- AI/LLM: 7 concepts → 1 bundle (LLMCost) + 2 standalones
- CRO/UX: 11 concepts → 1 bundle (CroTool) + 7 standalones
- Garden: 4 concepts → 0 bundles + 4 standalones (virtual bundle proposal above)
- Adtech: 4 concepts → 0 bundles + 4 standalones (virtual bundle proposal above)
- Sport: 6 concepts → 0 bundles + 6 standalones (bundling not recommended)
- Other: 17 concepts unchanged

Information-loss audit (no concept dropped)

- v5 had 100 ranked concepts. v5 BUNDLED has 100 concepts (24 in 6 bundles + 76 standalones).
- Every concept's APS / Why / AVM / vertical / domain-hint preserved verbatim from v5.
- Original v5 numbering preserved (column #) — bundles re-present, don't renumber.
- Cuts from v2.1 + Promotions sections (in v5) NOT included here — they are historical context, not picks. Reference v5 markdown for that audit trail.
- Honest gaps + Methodology notes preserved at top + bottom.

Net change from v5: zero concepts added, zero removed; structure regrouped to surface domain compounding.

End of BEST_OF_BEST_TOP100_v5_BUNDLED.md. Recalibrate when (a) HoldLens hits €1k/mo revenue, (b) any 3 fleet sites cross 1k Plausible sessions/mo, (c) HoldLens sub-extension #2 ships and 30d traffic ratio measures (calibrate stacking factor).
